(54) Title: 1-(H-1,2,4-TRIAZOL-1-YL)BUTAN-2-OL DERIVATIVES

(I)

(57) Abstract: The present invention is directed to new 1-(1H-1,2,4-triazol-1-yl)butan-2-ol derivatives of the formula (I), and pharmaceutically acceptable salts thereof wherein Q, R, X, Y and Z are the same as defined in the claims and the description. 1-(1H-1,2,4-triazol-1-yl)butan-2-ol derivatives of the present invention have antifungal activity and are useful for the treatment of fungal diseases.

1-(H-1,2,4-Triazol-1-yl)butan-2-ol Derivatives

Azole antifungal agents are currently most frequently used for systemic mycosis, but none of them fully fulfil the necessary clinical requirement; such as efficacy against major systemic mycoses including disseminated aspergillosis, safety, and water solubility for parenteral formulation. Although the systematic mycoses caused by *Candida*, *Cryptococcus* and *Aspergillus* spp. are still major infections, there is an increasing medical need for new antifungal agents with broader spectrum that cover not only the above mentioned major pathogens but also emerging pathogens such as *mucor* spp. Several new azole type agents have been developed to fulfil these unmet medical needs, such as the compounds disclosed in EP 0 667 346 and EP 0 440 372. The present invention intends to provide antifungal agents having broad antifungal spectrum covering *Aspergillus* as well as *mucor* spp., their intermediates, a process for their manufacture, an antifungal composition containing them and the use thereof.

The present invention provides compounds with a much broader antifungal spectrum compared to existing azoles. Namely, the compounds of the present invention have a surprisingly high level of antifungal activity, in particular against *Aspergillus* spp., and *mucor* spp. such as *Rhizopus* spp., and *Absidia* spp.

The present invention relates to novel 1-(1H-1,2,4-triazol-1-yl)butan-2-ol derivatives of the formula (I),

wherein

Q is a phenyl ring, optionally substituted by 1 to 3 halogen atom(s);

R is hydrogen, hydroxy, carboxy, carbamoyl, cyano, lower-alkyl, lower-alkoxycarbonyl or lower-alkoxy, whereas lower-alkyl, lower-

- 2 -

and pharmaceutically acceptable salts thereof.

10 The present invention also relates to pharmaceutical compositions containing above 1-(1H-1,2,4-triazol-1-yl)butan-2-ol derivatives, the use of such derivatives for the prophylaxis or treatment of mycoses as well as to processes for production of such 1-(1H-1,2,4-triazol-1-yl)butan-2-ol derivatives.

Determination of in vitro antifungal activity

In vitro antifungal activities of 1-(1*H*-1,2,4-triazol-1-yl)butan-2-ol derivatives of the formula (I) of the present invention were evaluated by determining the 80% inhibitory concentration (IC₈₀), which was calculated as the lowest concentration of an antifungal to inhibit the growth of fungus to 20% turbidity compared with the drug-free control growth spectrophotometrically. For clinical use, 1-(1*H*-1,2,4-triazol-1-yl)butan-2-ol derivatives of the formula (I) or salt forms thereof and the like can be administered alone, but will generally be administered in pharmaceutical admixture formulated as appropriate to the particular use and purpose desired, by mixing excipient, binding agent, lubricant, disintegrating agent, coating material, emulsifier, suspending agent, solvent, stabilizer, absorption enhancer and/or ointment base. The admixture can be used for oral, injectable, rectal or topical administration.

In more detail, as mentioned earlier, medicaments containing a compound of formula I are also an object of the present invention, as is a process for the manufacture of such medicaments, which process comprises bringing one or more compounds of formula I and, if desired, one or more other therapeutically valuable substances into a galenical administration form.

The pharmaceutical compositions may be administered orally, for example in the form of tablets, coated tablets, dragées, hard or soft gelatine capsules, solutions, emulsions or suspensions. Administration can also be carried out rectally, for example using suppositories; locally or percutaneously, for example using ointments, creams, gels or solutions; or parenterally, for example using injectable solutions.

For the preparation of tablets, coated tablets, dragées or hard gelatine capsules the compounds of the present invention may be admixed with pharmaceutically inert, inorganic or organic excipients. Examples of suitable excipients for tablets, dragées or hard gelatine capsules include lactose, maize starch or derivatives thereof, talc or stearic acid or salts thereof.

Suitable excipients for use with soft gelatine capsules include for example vegetable oils, waxes, fats, semi-solid or liquid polyols etc.; according to the nature of the active ingredients it may however be the case that no excipient is needed at all for soft gelatine capsules.

For the preparation of solutions and syrups, excipients which may be used include for example water, polyols, saccharose, invert sugar and glucose. For injectable solutions, excipients which may be used include for example water, alcohols, polyols, glycerine, and vegetable oils. For suppositories, and local or percutaneous application, excipients which may be used include for example natural or hardened oils, waxes, fats and semi-solid or liquid polyols.

The pharmaceutical compositions may also contain preserving agents, solubilising agents, stabilising agents, wetting agents, emulsifiers, sweeteners, colorants, odorants, salts for the variation of osmotic pressure, buffers, coating agents or antioxidants. They may also contain other therapeutically valuable agents.

In summary, a pharmaceutical formulation for oral administration may be granule, table, sugar coated tablet, capsule, pill, suspension or emulsion, which for parenteral injection, for example, intravenously, intramuscularly or subcutaneously, may be used in the form of a sterile aqueous solution which may contain other substances, for example, salts or glucose to make the solution isotonic. The antifungal can also be administered in the form of a suppository or pessary, or they may be applied topically in the form of a lotion, solution, cream, ointment or dusting powder.

The daily dosage level of 1-(1*H*-1,2,4-triazol-1-yl)butan-2-ol derivatives of the formula (I) of the present invention is from 0.1 to 100 mg/kg when administered by either the oral or parenteral route. Thus tablets or capsules can contain from 5 mg to 1000 mg of active compound for administration singly or two or more at a time as appropriate. In any event the actual dosage can be weight and response of the particular patient.

1-(1*H*-1,2,4-Triazol-1-yl)butan-2-ol derivatives of the formula (I) of the present invention and salts thereof have activity against a variety of plant pathogenic fungi, including for example *Pyricularia oryzae*, *Pythium aphanidermatum*, *Alternaria* spp., and *Paecilomyces variotii*.

Thus, they can be applied for agricultural and horticultural purposes preferably in the form of a composition formulated as dusting powders, or granules, seed dressings, aqueous solutions, dispersions or emulsions, dips, sprays or aerosols. Such compositions may contain such conventional carriers, diluents or adjuvants as are known and acceptable in agriculture and horticulture. Other compounds having herbicidal or insecticidal activity or additional antifungal compositions can be applied in a number of ways, for example they can be applied directly to the plant foliage, stems, branches, seeds or roots or to the soil or other growing medium, and they may be used not only to eradicate disease, but also prophylactically to protect the plants or seeds from fungal attack.

The following examples illustrate the preferred methods for the preparation of the compounds of the present invention, which are not intended to limit the scope of the invention thereto.
